Goldman Sachs

Applied AI Researcher, Vice President

Dear Hiring Manager,

I'm writing to express my interest in the Applied AI Researcher position at Goldman Sachs. With 10+ years building AI/ML systems and production software in regulated, data-intensive environments, I bring the blend of applied research depth and engineering execution that this role demands.

My experience maps directly to the challenges your Applied AI Research team tackles. As CTO and Co-Founder of CopyCatch.AI, I architect ML pipelines for content analysis and pattern recognition at scale. Previously at Henry Ford Health System, I spent 4+ years building predictive models and data-driven applications over large-scale datasets, applying machine learning to real-world decision-making in a highly regulated (HIPAA) environment. Independently, I've designed and built algorithmic trading systems for real-time financial market execution, giving me hands-on experience with time series analysis, quantitative strategies, and the low-latency demands of financial infrastructure.

At CoVerified (Y Combinator W21), I built a platform from zero to 450K+ users that processed sensitive data in real time with predictive modeling capabilities. That experience, scaling production ML systems under pressure with CDC collaboration and MIT investment, taught me what it takes to ship reliable, high-quality code when the stakes are real.

I'm proficient in Python and have deep experience across the AI/ML stack: generative AI, deep learning, NLP, computer vision, and applied predictive modeling. I've led cross-functional teams, driven technical strategy, and consistently delivered production-ready systems, not just prototypes. I'm also comfortable representing technical work externally, having presented at hackathons (2023 NextGrid/LabLab AI winner) and contributed to open governance frameworks in the blockchain space.

What excites me most about this role is the opportunity to apply cutting-edge AI research to the unique challenges of financial markets at Goldman Sachs. The intersection of quantitative research and artificial intelligence is where I've been building my career, and I'd welcome the chance to do that work at the scale and rigor Goldman Sachs demands.

I'd love to discuss how my background aligns with your team's goals.

Best regards,
Frank Albanese
